

**Produce safe feed even under high price pressure!
Use the potential of the multi-function tool WH67®!**

The currently quite high raw material prices have a direct effect on compound feed prices and the question arises as to how one can produce a safe, high-performance and at the same time inexpensive compound feed under these special conditions.

In this context, the WH67® has enormous potential due to its versatility, because it combines many functions in just one product:

- Protection against toxic substances such as AFLA, ZEA and endotoxins: **WH67® as a detox tool**
- Strengthening the beneficial intestinal microbiome: **WH67® as a protective “biotic”**
- Protection of the intestinal barrier e.g., in the event of inflammation: **WH67® as an intestinal tonic**
- Increase in nutrient availability: **WH67® as an absorption enhancer**

➔ **Stable cycles, robust animals, consistent performance**

WH67® has proven itself over many years in all pig feeding. Initially used as a quick help with necrosis and cannibalism, WH67® has developed into a fixed component in sustainable feeding concepts.

- Start building a functioning gut with the pregnant sow with WH67®. You benefit from easier births, better milk yield and more robust piglets.
- In piglet feed, WH67® ensures more stable digestion and thus better weight gain, fewer diarrhoea incidents and lower drug costs - especially when weaning and with increased pathogen pressure.
- WH67® does a good job in ear and tail necrosis as well as other endotoxin-induced events (e.g. inflammation and necrosis syndrome (SINS))

The targeted use of WH67® as a multifunctional additive lowers feed costs and not performance!
